

CLASH OF THE **CLAWS**

RVCollegeofEngineering_Cosmos

Your phone should manage your life, not distract from it.

Problem Statement

Why we selected this theme — Daily Utility (Smartphones)

- Smartphones are used every day for productivity and scheduling
- Current apps are reactive, not intelligent
- Users face overload, missed tasks, and poor planning
- We wanted to make smartphones proactive assistants

What problem are you solving

- Missed classes, meetings, and deadlines due to schedule clashes
- Daily overload causing stress, fatigue, and burnout
- Traffic and delays disrupting planned routines
- Productivity apps ignore real-life context like energy and location
- Users switch between multiple apps instead of one smart assistant

Who Faces It? (Persona)

- Students managing classes, assignments, exams, and clubs
- Professionals handling meetings, deadlines, and commute stress
- Productivity-focused users juggling multiple daily tasks
- Heavy smartphone users dependent on reminders and scheduling apps
-

Why is it Important?

- Poor planning leads to stress and reduced productivity
- Daily overload causes mental fatigue and burnout
- Existing apps react after problems happen instead of preventing them
- Smartphones already have context data that is currently underutilized

Current Solution & Gaps

Existing Solutions	What's Missing / Broken	Opportunity
Google Calendar & reminder apps	Only show schedules, no prediction of delays or conflicts	Predict conflicts before they happen
Todoist / Notion	No understanding of stress, fatigue, or overload	Build energy-aware productivity planning
Siri / Google Assistant	Reactive command-based assistants	Create proactive AI-driven decision support
Focus mode & DND apps	Manual switching between modes	Auto-switch modes based on context
Google Maps	Only route optimization, not daily planning	Combine commute + schedule intelligence
Notification systems	Too many generic alerts	Smart risk-based notifications
Scheduling apps	No “what-if” simulation capability	Simulate future outcomes and ripple effects
Existing AI assistants	No learning of personal habits	Build a continuously learning Digital Twin

Your Solutions

What We Built

LifePilot — an AI-powered predictive context engine for smartphones

Helps users manage daily schedules intelligently using smartphone context data

Combines AI-driven planning, simulation, and smart interventions in one system

Acts like a proactive assistant instead of a normal reminder app

Optimizes productivity, focus, and well-being automatically

Core Idea

Creates a Digital Twin of the user to predict conflicts, delays, stress, and schedule impact before they happen

Continuously analyzes location, activity, calendar, phone usage, and energy patterns

Simulates future outcomes and suggests optimized actions proactively

Learns user habits and adapts recommendations over time

Uses predictive intelligence instead of reactive reminders

Key Features

Context & Intent Detection

Prediction Engine

What-If Simulation

Smart Dashboard & Predictive Notifications

Energy Optimization & Auto Mode Switching

Demo/Product Walkthrough

Enhancing Daily Productivity with Smart App Features

User opens app to view timeline, risk levels, and daily insights

Smart Dashboard: Initial app launch

User receives one-tap AI recommendations

Smart Suggestions: AI-driven advice

App automatically opens Maps or blocks distractions

Smart Interventions: Proactive actions

App analyzes schedule, traffic, activity, and timing automatically

Prediction Engine: Automatic analysis

User changes leave time or skips an event

What-If Simulation: Scenario planning

App adapts using user habits and delays

Learning System: Continuous improvement

Tech & Architecture

Tech Stack

React + TypeScript frontend

Tailwind CSS for UI styling

App.tsx manages main app state

engine.ts contains core logic

LocalStorage for user twin data

AI Usage

Context & intent detection engine

Digital Twin model for user routine

Prediction engine calculates delays and risks

Simulation engine tests “what-if” decisions

Energy engine estimates fatigue, overload, focus

Simple System Flow

LifePilot – Simple System Flow

Impact & Use cases

Real Life Scenario

How LifePilot Helps

Student leaving late for 9 AM class

Predicts **traffic delay**, warns early, and suggests **leave time** before attendance is missed

Professional with continuous meetings

Detects **mental overload** and automatically enables **Focus / DND mode**

Exam preparation at night

Blocks **Instagram / YouTube distractions** and prioritizes study-related tasks

Daily commuter during peak traffic

Simulates **route delays** and recommends a faster departure plan

Scale Potential

- Can integrate with **Google Calendar, Maps, Smartwatches, and Wearables**
- Useful for **students, working professionals, and heavy smartphone users**
- Supports future **on-device AI assistants** with personalized decision-making
- Can scale into a **smartphone life operating system** instead of just a productivity app

Differentiation

Why LifePilot Stands Out

- Combines **Calendar + Maps + Phone Usage + Activity** in one intelligent system
- Predicts “**You may miss your class**” before the problem happens
- Detects real issues like **traffic delays, overload, late-night fatigue, and distraction patterns**
- Simulates decisions like “**What if I leave late?**” or “**What if I skip this event?**”
- Automatically performs actions like **DND, Maps launch, and alert escalation**

Strong MOATs

Digital Twin Learning

Learns:

- delay habits,
- commute patterns,
- distraction behavior,
- productivity timings

for personalized predictions.

Smartphone Context Engine

Uses:

- location,
- app usage,
- battery,
- activity,
- schedule data

to make real-time intelligent decisions.
